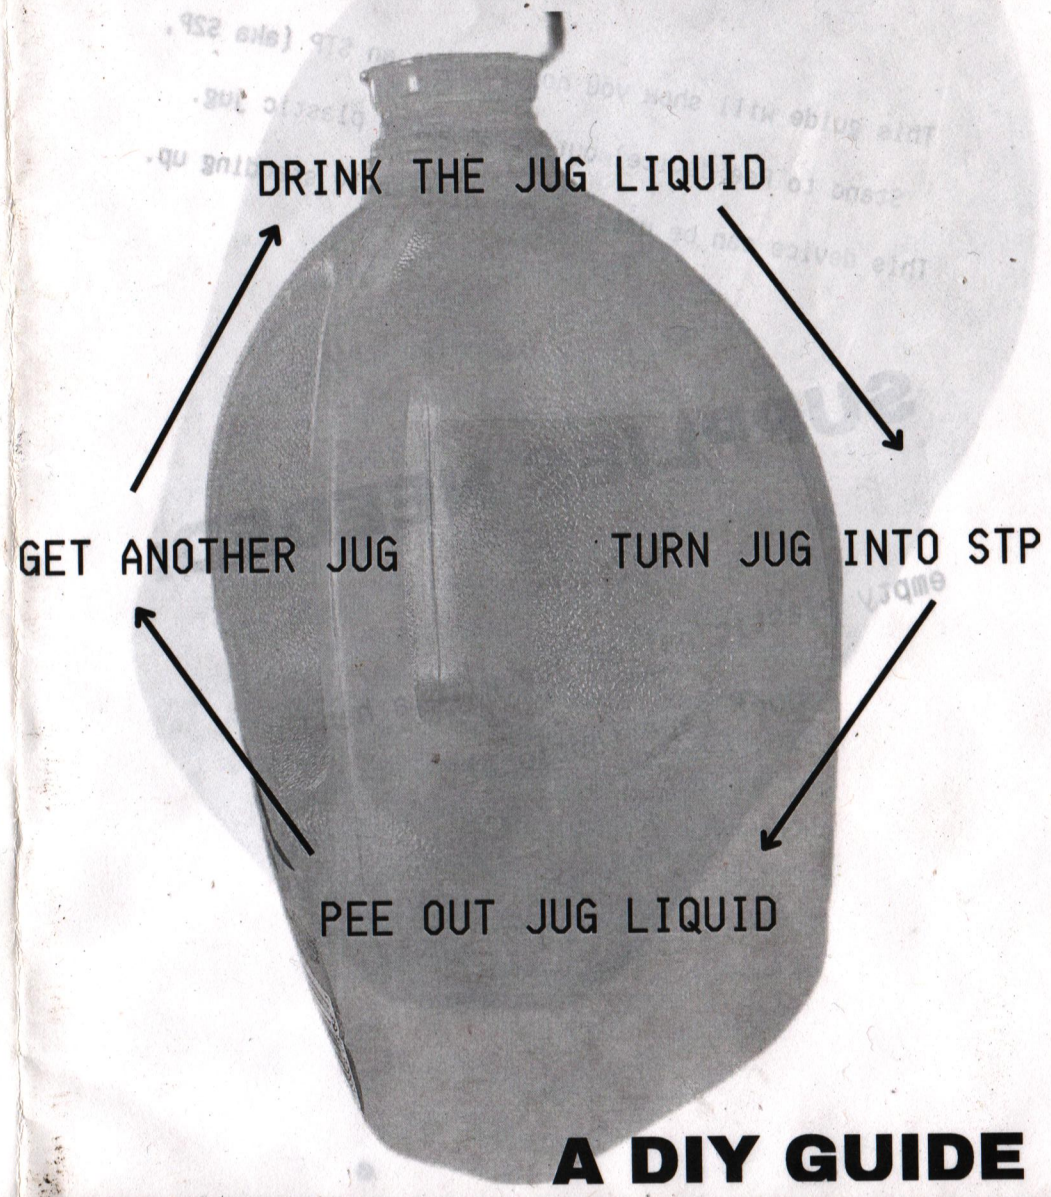
HOW TO USE A PLASTIC JUG TO PEE STANDING UP



A DIY GUIDE

What's an STP?

A device used to Stand To Pee.

This guide will show you how to make an STP (aka S2P, Stand to Pee device) out of an empty plastic jug. This device can be used to pee discreetly standing up.

SUPPLIES NEEDED:

Scissors

empty plastic gallon jug with a handle

duct tape (optional)

TEST IT OUT AT HOME, IN THE BATH TUB, OUTSIDE, WITH A FRIEND, ETC

PLAY AROUND

I LITERALLY PISSED DOWN MY LEG TRYING TO DEMONSTRATE

IT TAKES PRACTICE

DOG BLESS THE GAY OOGLES WHO SHOWED ME THIS,

NOW I PISS IT ON TO YOU

PISS EVERYWHERE

This resource was made by a transmasculine piss fetishist for you, reader, with no assumptions whatsoever about your body, gender, or intended use of this information.
"They tried to bury us, but they didn't know I peed" -@The_Cumming_Memesurrection

Now for the fun part- test it out!
Here's some tips for using an STP without making a mess.
While it may seem difficult at first, it is totally possible to use an STP to relieve yourself while wearing pants without spilling a single drop. I believe in you, Sport.
The biggest tip I have is to aim the spout as downwards as you possibly can. You may find that you need to cut away excess plastic from the back of the device to get the right angle. You want to aim downwards because if you don't, your piss will run down the back of the STP and not into the spout.
Try to control your urine stream and let out a little at first, releasing more as you build confidence in the flow of your stream through the device.
Find your stance and posture and what feels right for your body.
Once you have your device prepared and ready- you can use it however, whenever you want. One could use this design to pee into bottles with small openings, in the alley outside the venue, onto a friend or lover, onto the grave of a fascist, the options are endless.

This is a pretty simple device which can be modified to fit your body type. There are plenty of stand to pees out there that you can buy which range from fancy and extremely realistic multi-use packers (like the ones made by Emisil) to inexpensive durable antimicrobial plastic (like the Pstyle.)
This is a design for how to recycle an empty jug into a stand to pee device. This design is useful because it's practical in a pinch, its free, you can make it out of trash, and you can cut it to custom fit your body!

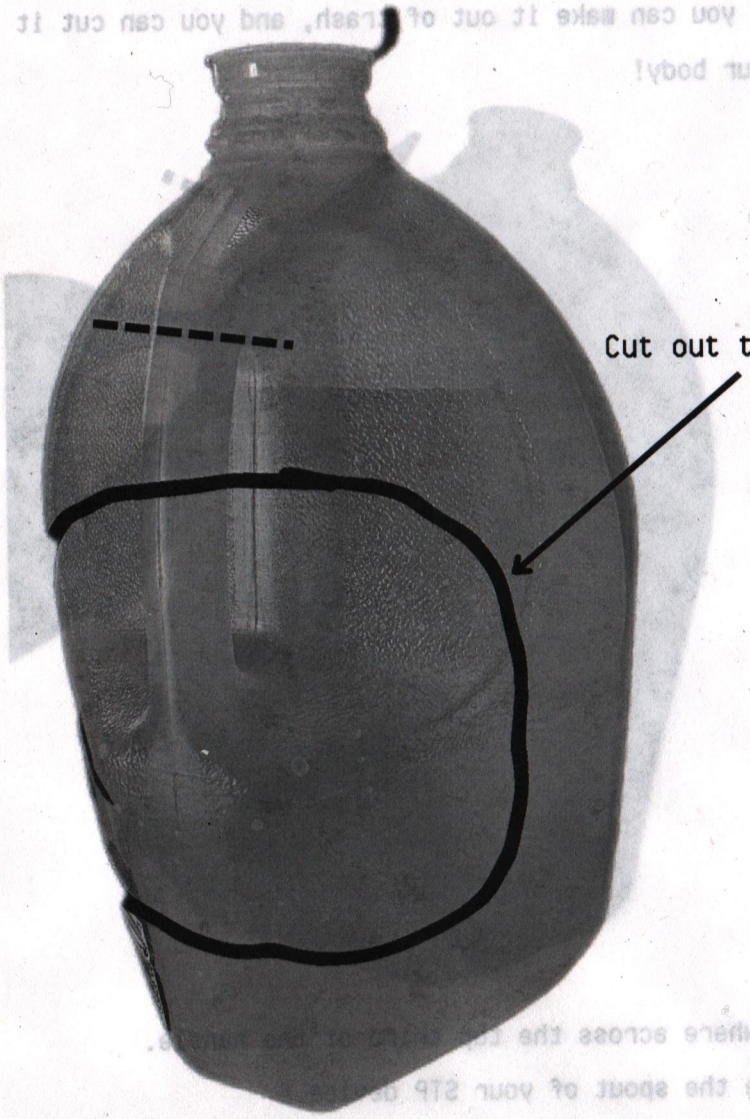
You're going to start by getting an empty plastic jug. You need the kind with a handle. The classic gallon milk jug shape. If you use a milk jug, rinse it out and wash the device before use.

Make a cut somewhere across the top third of the handle. This will become the spout of your STP device.

Cut a shape out of your jug along the base of the handle.

Cut a wide enough area that you get the curvature of the handle base. The inside of the cut out handle base will become the part of the STP device which you pee into.

You want to intentionally cut wider than what will fit between your legs, so that you can cut excess away later.

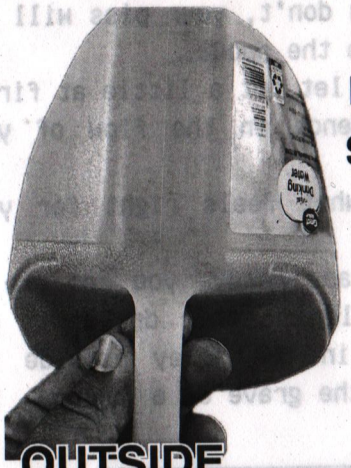


The inside of the jug piece is what sits against your body, with the handle spout pointing away from you.

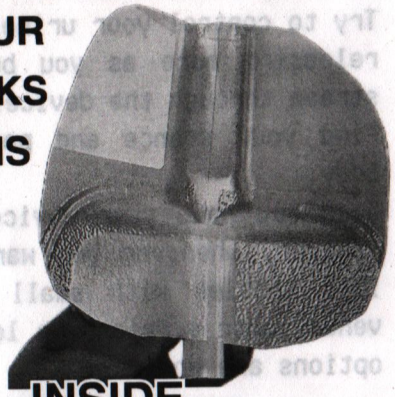
Once your shape is cut out, you can try putting it between your legs.

You'll be able to tell pretty quickly if more plastic needs to be cut away from the sides. Try not to cut away too much of the top or bottom of the device, to prevent liquid from overspilling.

NOW YOUR STP LOOKS LIKE THIS



OUTSIDE



INSIDE

Your STP should not feel sharp against you.

As you're modeling and shaping the device, make sure you are positioning the STP as if you were aiming to pee into the small well around the spout. Once you feel satisfied with the shape, you can line the outside with tape to soften the edges against your skin. This step is optional and the STP is still comfortably functional without adding tape.
